Be Water Wise

TIPS ON WATER FLUSHING:

- Anytime the water in a particular faucet has not been used for six hours or longer, flush your cold-water pipes by running the water until you notice a change in temperature. This could take as little as five seconds if there has been recent heavy water use such as showering or toilet flushing. Otherwise, the temperature change could take closer to two minutes. The longer water has been sitting in your home's pipes, the more lead it may contain.
- Only use water from the cold-tap for drinking, cooking, and making baby formula. Hot water is likely to contain higher levels of lead.
- The two actions recommended above are important to the health of your family. They may be effective in reducing lead levels because most of the lead in household water comes from the plumbing in your house, not from the local water supply.
- Conserving water is still important. Rather than running the water down the drain, consider using the water for other purposes such as watering your plants.
